

Data Centre Auditing

Our Data Centre audit report will highlight any possible weaknesses in Data Centre electrical and mechanical infrastructures, allowing you to avoid costly service outages in the future or any unplanned downtime to your IT services that could be referenced in the report you can easily review, communicate recommendations and work towards making improvements to mitigate potential future risks.

Just as a successful business naturally grows and expands, so do the IT services that it relies upon. Unfortunately, this growth does not always take place in a straightforward manner and, over time, additional Data Centre or server upgrades tend to take place in a piecemeal manner. This could potentially compromise the supporting environment and hardware services by creating points of failure.

To have a complete understanding, ranging from which spare parts you need to buy to

which driver you need to download to get your server up and running again, you need to know exactly what systems you are running. Data Centre infrastructure management (DCIM) programmes are playing an increasingly important role in the day-to-day operations of a Data Centre. The need for complete accuracy is vitally important if the time and effort put into the task is to be worthwhile. This is best achieved by keeping an up-to-date Data Centre Audit report.

Regardless of the size of audit you require, be it a single server room, a full Data Centre or even a cable audit, our specialist team of auditors will analyse the environment and hardware, including the condition of the facility, reviewing risks and identifying potential security issues as well as any points of failure. All of this key information can be compiled into a detailed report, which will include professional recommendations for moving forward.

Discovery & Analysis

Analysing current issues and future needs offering tailored, flexible and scalable solutions.
